**Paper:** Winter 2020/21 CPD Questions

**Personal Reflection:**

Survival and living conditions of octogenarians post-ruptured abdominal aortic aneurysm (rAAA) repair. Very informative regarding the outcome of octogenarians after ruptured aortic aneurysm repair. The percentage of survival rates of octogenarians post-rAAA repair after one year is high as is the percentage of those that return to live at home. Consideration for rAAA should not be based on age alone.

ESVS guidelines for management of venous thrombosis. Informative information of the pathway of what protocol to follow from diagnosis to treatment of venous thrombosis. Whole leg US should be implemented and anticoagulation can reduce propagation and future incidents of venous thrombosis.
