Paper: Spring 2022 CPD Questions

Personal Reflection:

1. It was interesting that this study found that those who were discontinued from regular follow-ups actually had a better survival rate. Discontinuing regular follow-up scans on those that tested negative on CT for endoleak could be beneficial to the Vascular Lab as it would free up appointments, lessen work load on employees and save on cost. Also, would be easier on the patient as they would not have to come in regularly for scans. This was a very insightful paper. It would be beneficial to discuss it with other colleagues and how it would benefit the lab and patients.
2. The Toshiba Aplio SMI is a definite interest. The effectiveness, efficiency and non-invasive nature of this new technology is amazing and could improve results in the Vascular Lab.
