**Paper:** Summer 2021 CPD Questions

**Personal Reflection:**

The use of tUS for assessment of AVF stenosis appears to be very effective and efficient as it is as accurate as DUS, less time consuming as DUS, less physically demanding on the vascular scientist and possibly more cost effective than DUS. This could be beneficial to the future practise of the vascular lab.

It appears safe to discontinue surveillance in patients within this cohort with the smallest AAA, and due to age and other factors, larger AAA can be treated conservatively saving time and money.
