

**Victoria Bautista** has completed this personal reflection on **30/08/2024**

**Paper:** Spring 2024 CPD Questions

**Personal Reflection:**

The role of vascular laboratory in the management of Eagle syndrome - Excellent and informative article! It highlights the importance of obtaining proper patient history and really listening to patients complaints/symptoms. It is interesting that an elongated styloid process can cause neck, throat and ear pain, neurological symptoms and damage to the carotid arteries. I will now put into practice manoeuvres if patients have symptoms due to positioning.

Vascular Ehlers-Danlos Syndrome: Imaging Findings - This was a very informative article regarding patients with vascular EDS and its aetiology, prevalence, and how the arteries are affected. This is another article that highlights the importance of knowing patient history. When knowing that a patient has Vascular EDS, it may be beneficial to check the most common arteries that are affected.
