

04/08/2021, 16:43, UA Carotid and Vertebral

Duplex scanning demonstrated a widely patent right internal and common carotid arteries post endarterectomy. There is mixed echo plaque in the left internal carotid artery causing a moderate stenosis. There are elevated velocities in the right external carotid artery suggesting stenosis. Vertebral and subclavian artery velocities were within the normal range bilaterally.

Conclusion:

1. (R) ICA/CCA patent post endarterectomy, minor narrowing, 1-15%.
2. (L) ICA moderate stenosis, 50-79% (nearer 65%). Plaque type: mixed; plaque length 22mm and distal ICA diameter 6.5mm.
3. (R) ECA stenosis.
