Pre-operative scan of right internal and common carotid arteries:

No change demonstrated since last scan yesterday. There was a mixed-echo plaque at the origin of the right internal carotid artery causing a severe stenosis/pre-occlusion. The artery appears patent distal to lesion but of reduced calibre with low flow/trickle flow and flow not visualised at level of mandible due to low flow and noise, ? patency.

Conclusion:

(R) ICA origin critical stenosis/pre-occlusion, 80-99%.

Reported By: Igor Stanisic, Clinical Vascular Ultrasound Scientist.
